**MD Item -- upgrade mariadb on
halddb/halddb-ext complete**

19-Jul-16 19:28 M_Wise

**SYSTEMLOG
| MAINTLOG**

The maintenance task to update the mariadb servers on halddb and halddb-ext, and to re-synchronize their various replicas is complete. Everything went very smoothly, following a new procedure for updating tarball-based mariadb installations, available at: <https://cniweb.jlab.org/node/738>.

There was one minor issue.. The dump and restore of the DB to re-sync the full replica of halddb to halddb-ext stopped when it hit the portion to create a view whose "owner" was defined as a non-existent user account. After some rummaging around through the dump file, I was able to find and change the owner to someone whose account still exists and the process completed fine.

In the end, the server both look fine and I am hopeful that this has resolved the longstanding small desync between the rcdb DB on gluondb1 and its twin on halddb.
