I will be at SESAPS.

I just have two issues on my list:

1. Matching data and MC efficiencies. I think that we are okay with the data efficiency calculation, Mahmoud should look at the MC efficiency using some of the samples that Thomas Britton is generating.
2. There seems to be a slight momentum dependence of the Start Counter time with momentum. I'm not sure if this is related to the time walks or if it's something else. Alex A. has been looking into this a little bit more.

Cheers,  
Sean

Guys,

Start Counter meeting tomorrow?
