

ρ Meson Spin-Density Matrix Elements

$$\gamma p \rightarrow \rho(770)p$$

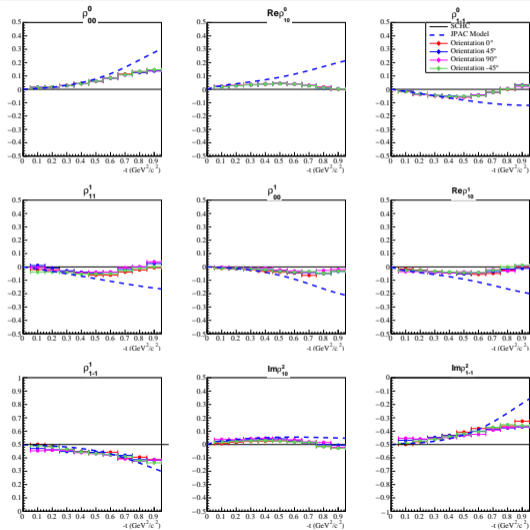

Alexander Austregesilo

Amplitude Analysis WG Meeting
November 16, 2020

Problem Presented in May

$$\gamma p \rightarrow \rho(770) p$$

- 0.1 GeV²/c² bin width in t
- Statistical errors from Minuit
- Discrepancy between 0° and 90°
- Largest for small t

$$P_{\sigma} = 2\rho_{1-1}^1 - \rho_{00}^1$$

Pull Distributions

As a function of ϕ

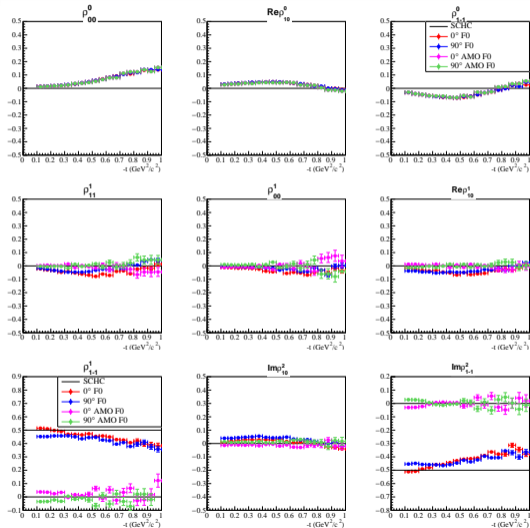

π^+

π^-

No Kinematic Fit

$\gamma p \rightarrow \rho(770)\rho$

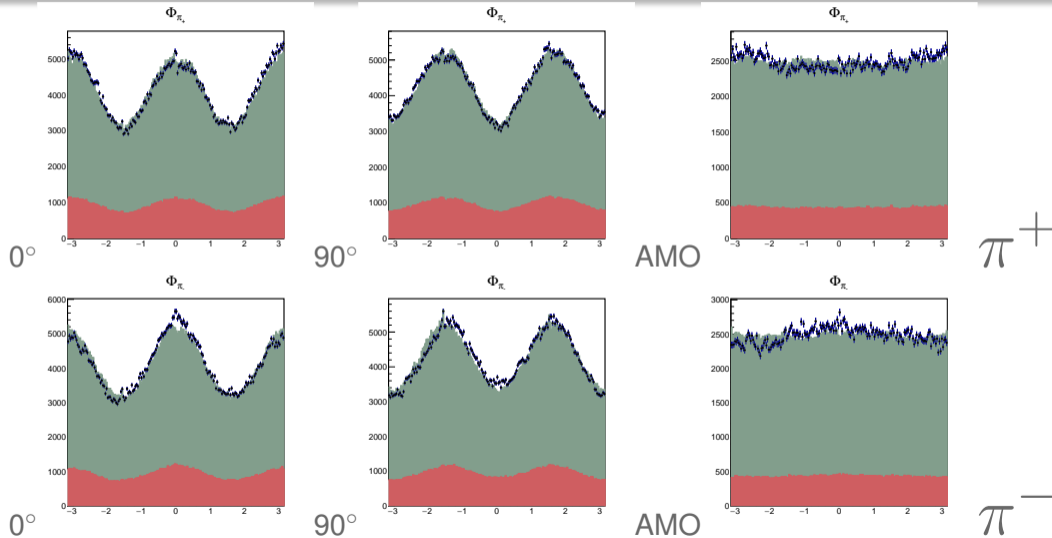

- New trees without KF
- Bias visible in AMO
- Dependent on orientation

$$P_{\sigma} = 2\rho_{1-1}^1 - \rho_{00}^1$$

ϕ Distributions for 0° , 90° and amorphous

Pion Track Distributions

by charge (run 30730, 90°)

π^+

Pion Track Distributions

by charge (run 30730, 90°)

π^-

Summary

- Study tracking bias in more detail to understand the source of the problem, extrapolate to TOF/FCal
- Play with detector positions in MC to reproduce effect in simulation (Simon)
- Separate alignment for oppositely charged tracks (Keigo)
- Additional systematic studies (Jamie Fitches)
