Daily SRC/CT Analysis Meeting

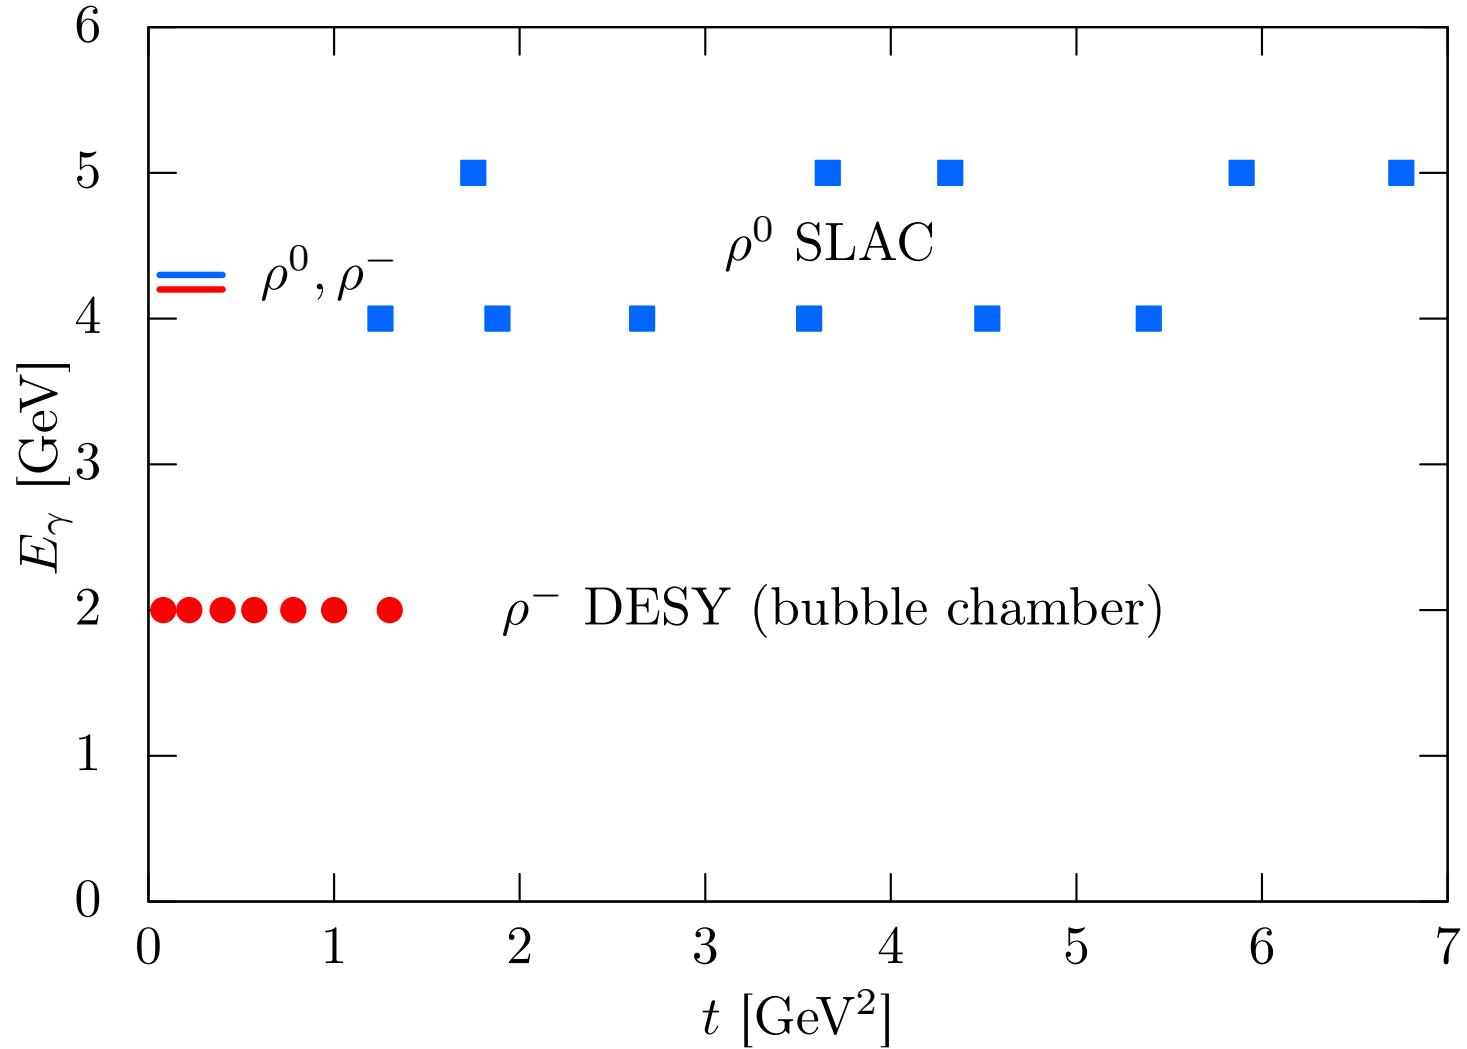

Summary

- ρ^- photoproduction has only been measured in the 1970s using bubble chambers at low $|t|$.
- In the measured kinematics, ρ^0 has 15x higher cross section than ρ^- .
- These data are consistent with our high $|t|$ model.

References

Kinematics

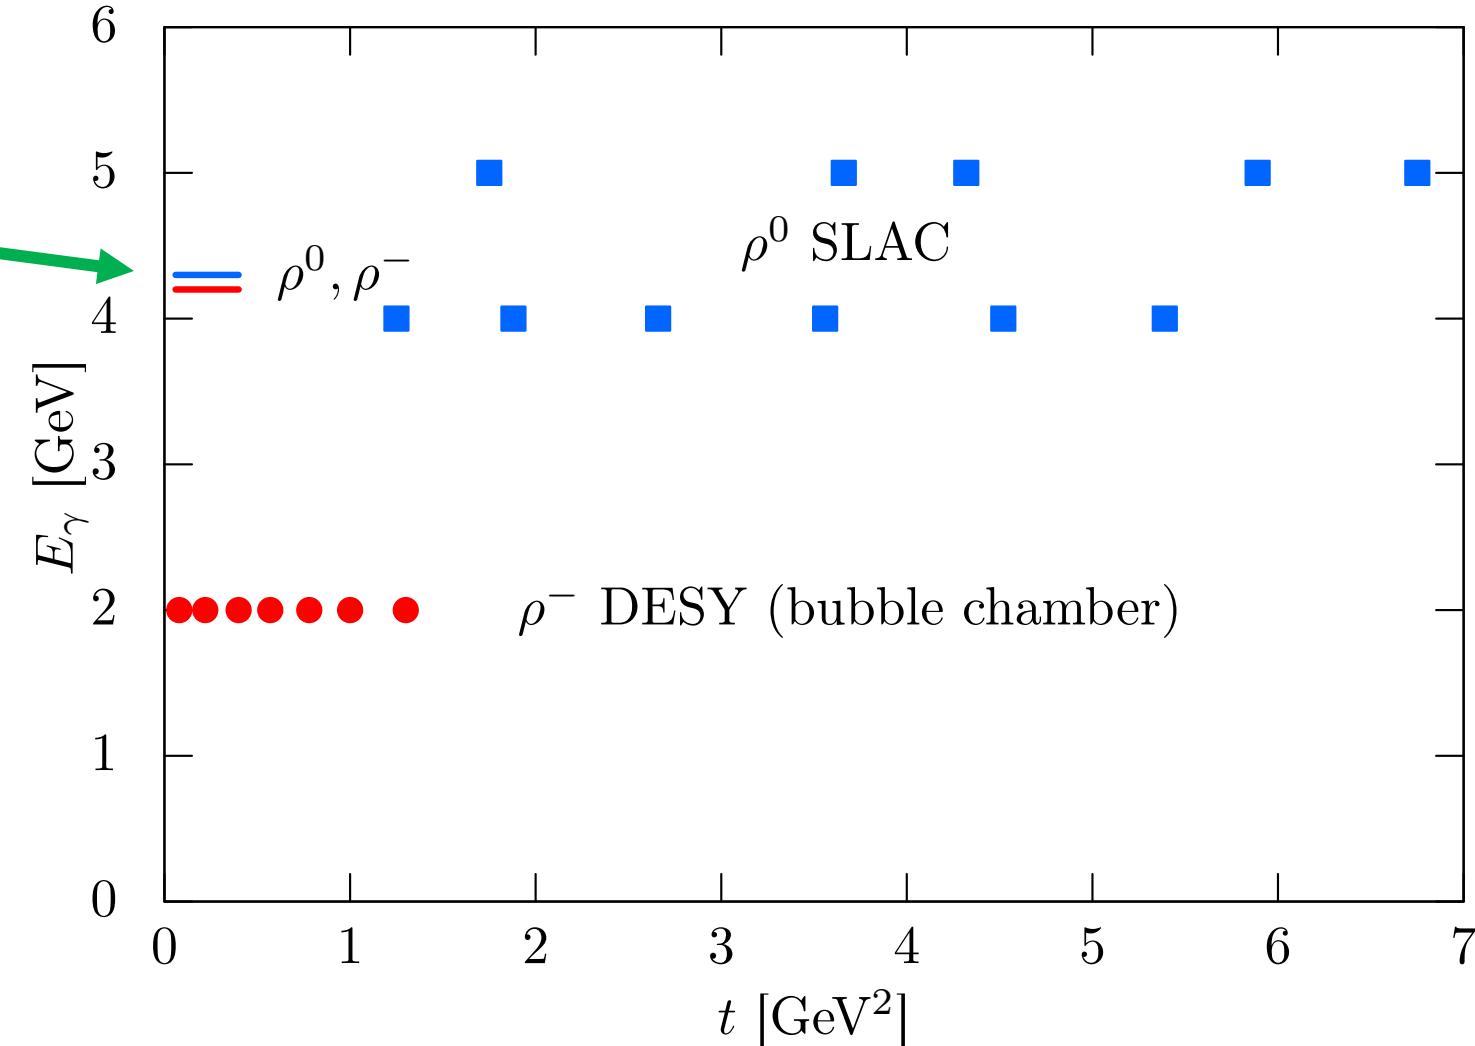

Kinematics

We can compare
 $\gamma n \rightarrow \rho^- p$ and
 $\gamma p \rightarrow \rho^0 p$ in the same kinematics!

$\gamma p \rightarrow \rho^0 p$:
 $\sigma = 15.9 \pm 1.4 \mu\text{b}$

$\gamma n \rightarrow \rho^- p$:
 $\sigma = 1.1 \pm 0.4 \mu\text{b}$

15 x difference!

ρ^0 differential cross section comparison

- Our model for $\gamma p \rightarrow \rho^0 p$:

$$\frac{d\sigma}{dt} = Ae^{-B|t|} + Cs^{-7}(1.2 - \cos\theta_{CM})^D(1.05 + \cos\theta_{CM})^E$$

- SLAC bubble chamber paper's model

$$\frac{d\sigma}{dt} = \alpha e^{-\beta|t|}$$

ρ^0 differential cross section comparison
