## Rate vs. 0.1

$$
\gamma+p \rightarrow \rho p \rightarrow \pi^{+} \pi^{-} p
$$

Nathaly Santiesteban

## Recalling for ${ }^{4} \mathrm{He}$

$$
\begin{aligned}
& E_{\gamma}>7 \mathrm{GeV} \\
& -\mathrm{t}>1 \mathrm{GeV}^{2} \\
& -\mathrm{u}>2 \mathrm{GeV}^{2}
\end{aligned}
$$

Note: horizontal lines represent the bin size

## From Empty Cell runs

Runs: 30333, 30334, 30336, 30337, 30564, 30728, 40903, 41386, 41615, 51011, 51013, 51556 Total Flux: $1.55 \mathrm{E}+12 \gamma$ on target for the empty cell run
Number of events calculated estimating: 2E7 $\gamma / \mathrm{s}$

Note: horizontal lines represent the bin size

## Note: the empty cell used an amorphous radiator

## Hall D LH2 Cryotarget

Values listed below are nominal. Final dimensions will be determined on an as-built basis.
CD Keith, Jan 28, 2014

| Item | Material | $\begin{aligned} & \text { E position } \\ & (\mathrm{cm}) \end{aligned}$ | Density ( $\mathrm{g} / \mathrm{cm}^{3}$ ) | Dimensions (cm) |
| :---: | :---: | :---: | :---: | :---: |
| Target entrance window | Kapton, 75um | (cm) | $1.42^{1}$ | 1.56 id, 75 um thick |
| Target fluid, conical $\sim 18 \mathrm{~K}, 16 \mathrm{psiA}$ | Liquid hydrogen, 30 cm | 0-30 | $0.0734^{2}$ | 2.42 dia. at entrance 1.56 dia. at exit |
| Target Exit window | Kapton, 75 um) | 30 | 1.42 | 1.56 id |
| Super-insulation | Aluminizedmylar+cerex (5 layers) | 30 | $2.9 \mathrm{mg} / \mathrm{cmI}^{2}$ per layer ${ }^{3}$ |  |
| Scattering chamber exit window | Aluminum, 25 um | TBD | 2.70 | 2.54 dia. |
| Target cell, conical (not in beam path) | Aluminized kapton, 127 um | -- | 1.42 | 2.42 id atent window 1.56 id at exit window |
| Super-insulation (not in beam path) | Aluminizedmylar+cerex (5 layers) | -- | $\begin{aligned} & 2.9 \mathrm{mg} / \mathrm{cm}^{2} \\ & \text { per layer } \end{aligned}$ | -- |
| Scattering chamber ${ }^{6}$ (not in beam path) | Aluminum-lined Rohacell | -- | $\sim 110 \mathrm{mg} / \mathrm{cm}^{3}$ | 11.1 OD, 1 thick |

Data is analyzed by selecting windows 2 and 3

|  | $\mathrm{g} / \mathrm{cm} 3$ | Lengh $[\mathrm{mm}]$ | Atoms/cm2 |
| :---: | :---: | :---: | :---: |
| Kapton | 1.42 | 0.01 | $8.55 \mathrm{E}+25$ |
| Aluminum | 2.7 | 0.0025 | $6.5 \mathrm{E}+26$ |

To calculate the rate from the simulation for the end-caps:
Thickness: 1.73E20
Flux: 2E7 $\gamma / \mathrm{s}$
Scale it by :

$$
\begin{aligned}
& \rho\left({ }^{4} \mathrm{He}\right)=0.117 \mathrm{~g} / \mathrm{cm}^{3} \\
& \rho(\text { Kapton })=2.7 \mathrm{~g} / \mathrm{cm}^{3} \\
& \rho(\mathrm{Al})=1.42 \mathrm{~g} / \mathrm{cm}^{3}
\end{aligned}
$$

$\left(0.2^{*} \rho(\mathrm{Al})+0.8^{*} \rho(\right.$ Kapton $\left.)\right) / \rho\left({ }^{4} \mathrm{He}\right)=14.32$

$$
N_{e v}=\sigma \cdot \text { flux } \cdot \text { thickness } \cdot 14.32
$$

Units:

$$
\text { [ev / hour] }=[\mathrm{nb}][\gamma / \text { hour] [atoms /nb] }
$$

## Current work

* Understanding the efficiencies:

Why they are lower than $50 \%$ ?

## Current work

- Use the proper thickness of the target.

## + Data <br> MF+SRC Simulation MF Simulation <br> SRC Simulation

* Implement the final conclusion in the offline monitoring to properly normalize the data.

Plots are area normalized to match the data.

## For monitoring

* Currently for Monitoring
* 2pi1p Plugins creates a root file with all candidates. Running time: $\sim 6-8$ hours in a raw data file and $\sim 2$ hours in a rest file
* Macro reads the root file and make the plots.

$$
\begin{aligned}
& E_{\gamma}>7 \mathrm{GeV} \\
& -\mathrm{t}>1 . \mathrm{GeV}^{2} \\
& -\mathrm{u}>2 \mathrm{GeV}^{2}
\end{aligned}
$$
