

$\gamma n \rightarrow \pi^- p$ cross section extraction

$$\bullet \frac{d\sigma}{dt}(E_\gamma, t) = \frac{N(E_\gamma, t)}{\epsilon(E_\gamma, t)} \frac{A}{N_\gamma(E_\gamma) \rho L N_A} \frac{1}{dt}$$

• N : number of events

• ϵ : acceptance

• A : Atomic mass

• N_γ : photon flux

• ρ : density

• L : target length

• N_A : Avogadro's number

• dt : t bin size

$\gamma n \rightarrow \pi^- p$ cross section extraction

- Preliminary cross section

$\gamma n \rightarrow \pi^- p$ cross section extraction

- Preliminary cross section: compare with world data

$\gamma n \rightarrow \pi^- p$ cross section extraction

- Preliminary cross section: compare with world data

$\gamma n \rightarrow \pi^- p$ cross section extraction

- Acceptance with finer binning
