# FDC Efficiency: Data-MC comparison revisited

FDC Per Wire Efficiency: positive (red) and negative (blue) tracks
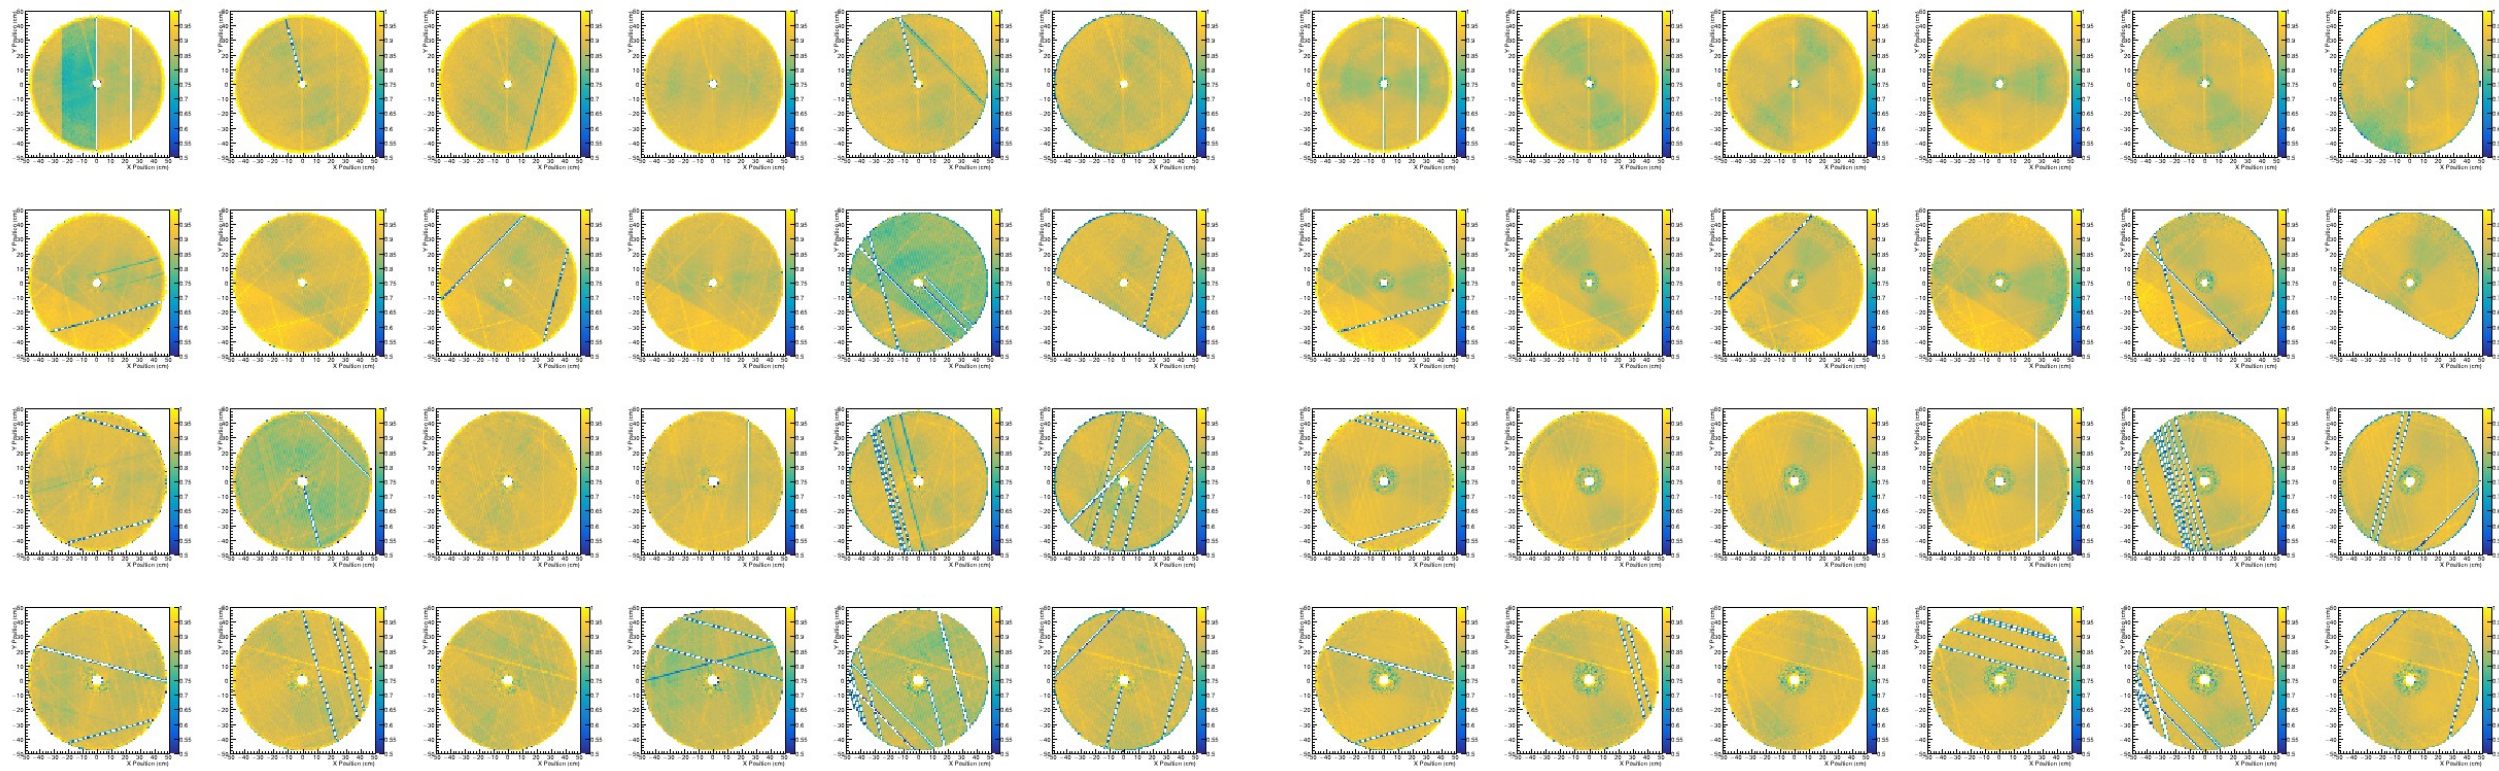

FDC Per Wire Efficiency: positive (red) and negative (blue) tracks BGGEN
Pseudo-Hit Efficiency (negative tracks)

Amorphous Run 30739

BGGEN MC (all runs)

Jefferson Lab
FDC Wire Efficiency vs Track position wrt wire

FDC Per Wire Efficiency Vs. DOCA: data (red) and bggen MC (blue)

- Minor dependence on drift length
- Drop at the end probably due to resolution of track and cell position
- Effect much larger without tight track selection used here

Jefferson Lab

Ultimately responsible for 30deg modulation

More mysteries: distribution of tracks

Amorphous Run 30739

BGGEN MC (all runs)

- Tracks close to beam hole?
- Position of hole wrt chamber?

Jefferson Lab
