

Background from bggen

gen_3pi reconstructed t distribution

Signal with amplitudes

$\rho\rho$ Background

$\rho\rho$ reconstructed t distribution

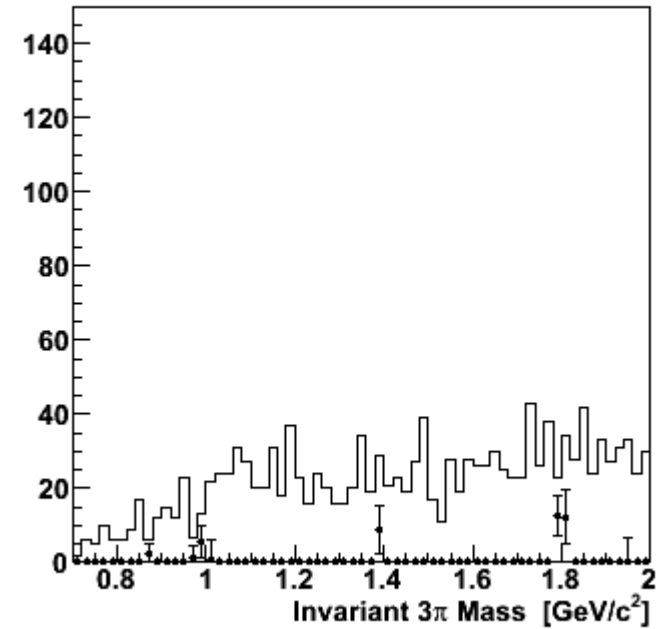

$1^+ \rho\pi S$

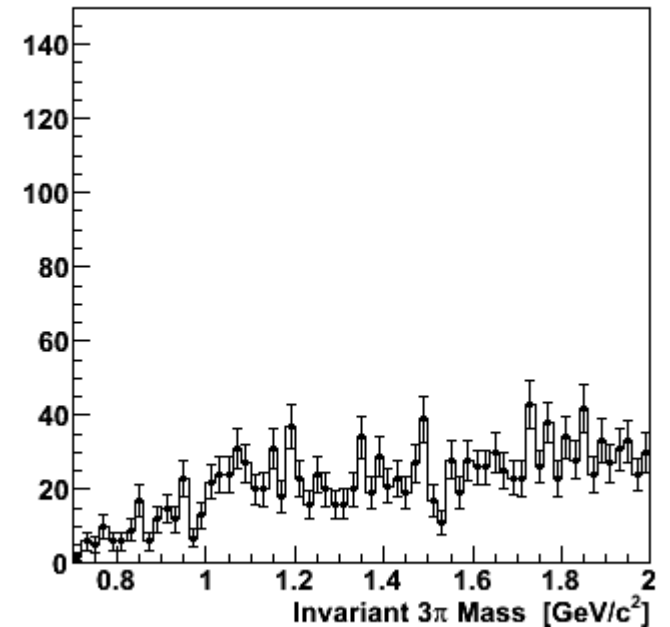

I fit the $\pi^+\pi^-\rho$ background that passes my cuts to a $\rho\pi$ S wave and a flat background. Instead of being absorbed by the background, almost all of it is in the 1^+ amplitude

The data points show the fit, the histogram is the data. These plots are not acceptance corrected.

Flat Background

3π All Waves

When I include more waves, the background is not isolated to a particular wave (like the rho pi S wave), nor is it absorbed by the flat wave.

The data points show the fit, the histogram is the data. These plots are not acceptance corrected.
